What's New in Web Resource 2.1

The Web Resource 2.1 release incorporates several usability and feature enhancements as well as a number of behind-the-scenes changes to address minor bugs and performance issues.

The most visible changes in this release are:

- Updated capability for sliding the dates for both projects and tasks. Whether to accommodate real or planned schedule changes, or to test various what-if scenarios, it is now possible to shift all dates related to a task, or to an entire project, to a different point in time.
- Ability to assign a resource for multiple independent periods within a single task. This can be applied to requirements for reoccurring or intermittent activities, or simply where a resource is unavailable for certain portions of the task.
- A new CSV import capability for the bulk addition of resources. Accessible through the online menus, this feature allows for the mass definition of new resources, with all of their associated attributes.
